Supplementary Appendix 7. Node-split model for assessment of inconsistency between direct and indirect comparison in all studies: for each treatment comparison that has both direct and indirect estimates, the analysis provides the mean and credible intervals (the value at 2.5% and 97.5% quantiles) for the direct, indirect and network estimates together with a Bayesian P-value for the related test of inconsistency between the direct and indirect evidence for each treatment comparison. NA, not available; CrI, credible interval.
